### **ABOUT US**

In 1988, John Gardner, a professor of physics at Oregon State University, lost his eyesight due to a complication from surgery to correct aspects of his glaucoma.

Refusing to let his disability limit what he could do, Professor Gardner established a research team to find methods to make graphical information accessible.

Established in 2000, ViewPlus has and continues to develop groundbreaking accessibility technology, from improved braille printers and hybrid ink/braille printers, to touchpads, and a large variety of software designed to make every aspect of document creation accessible.

Since our inception, we at ViewPlus have had one dream: to make information around the world accessible to everyone. From designing high quality software, to building world-class braille embossers, we work every day to make that dream a reality.
